Introduction

Wolf Systems provide products and services to the timber engineering industry. We manufacture and supply nailplates, metal webs and software for the design and manufacture of roof trusses, metal web joists and timber frame wall panels. Additionally, we also provide a comprehensive range of machinery for the manufacture of these components.

Company History

Wolf Systembau was started by Johann Wolf in 1966 in Scharnstein, Austria. The original activities of the company were construction within the agricultural industry. This consisted of concrete silos and buildings constructed of timber, steel and concrete. The company then expanded into other areas of the construction industry such as industrial, commercial and domestic buildings, manufacturing machinery for sawmills, timber frame wall panels and roof trusses, as well as harvesting timber from their own forests.

Having over 40 years experience in timber engineering, the Group operates from a state of the art office complex in Scharnstein, and employs 3000 staff in 14 European countries. Wolf Systembau is still privately owned by Johann Wolf and his family and all of the Group’s operations are construction related.

United Kingdom

Wolf Systems UK was formed in 1988 as an integral part of Wolf Systembau’s expansion into the world roof truss systems market. Having successfully established itself amongst its competitors, Wolf Systems now has a network of over 50 experienced trussed rafter manufacturers throughout the United Kingdom and Ireland.

Following the introduction of our market leading roof truss design software, we turned our expertise and knowledge of timber engineering to products and services for Floors and Walls. Expanding on the simple yet comprehensive interface found in the Roof software, easi-joist® has fast become adopted by many of our existing customers, and significantly, manufacturers using competitor systems. Together with products for Roofs and Floors, our Wall panel software provides the complete solution for Whole House Timber Engineering design and manufacturing.

In addition to our products, our Customer Services and Design Teams provide expert technical support and backup for software implementation, training and design.

Wolf Systems UK and Ireland Customer Network
The easi-joist® floor system offers clear benefits over sawn timber and other engineered floor joist systems. Not only does it out-perform sawn timber in span and dimensional stability, the added benefits of a greater bearing area and open web system make it easier to install for the carpenter, plumber and electrician, increasing valuable time and reducing cost.
Industry Associations

Wolf recognise the importance of being associated with the leading bodies operating within our industry. Wolf Systems are active members of The Trussed Rafter Association (TRA), The UK Timber Frame Association (UKTFA), BMTRADA, and The Engineered Wood Products Committee.

Being associated with these organizations ensures Wolf's products and services are always provided in strict accordance with current standards and working practices.

The Trussed Rafter Association (TRA) is the respected voice of the trussed rafter industry in the UK. The Association is committed to stringent standards of quality and service and sets a professional benchmark for the industry.

Members include the principal manufacturers of trussed rafters, industry suppliers and professionals involved in roof design and construction. TRA requires all its manufacturing members to have third-party supervised Quality Assurance and Professional Indemnity insurance so helping to ensure quality and peace of mind for the customer.

The Timber Research and Development Association (TRADA) is an internationally recognised centre of excellence on the specification and use of timber and wood products.

TRADA is a company limited by guarantee and not-for-profit membership-based organisation. TRADA’s origins go back over 70 years and its name is synonymous with independence and authority. Its position in the industry is unique with a diverse membership encompassing companies and individuals from around the world and across the entire wood supply chain, from producers, merchants and manufacturers, to architects, engineers and end users.

The UK Timber Frame Association (UKTFA) is the trade association representing over 85% of the UK timber frame manufacturers and also the sectors key suppliers. Established in 2002 they promote timber frame to the construction industry and the public; provide information and guidance, both technical and consumer; and aim to ensure that all sectors of UK construction fully exploit the benefits of timber frame.

The Irish Timber Frame Manufacturers’ Association (ITFMA) is the Trade Association for the timber frame manufacturing industry in Ireland. It is an independently constituted company limited by guarantee with no share capital. All full members are represented on the Board of Directors. Voting on issues is not based on turnover. The association is the recognised representative body for Timber Frame Manufacturers on the Island of Ireland and membership is synonymous with professionalism and quality. In addition, the ITFMA provide marketing, training and education of the timber frame concept.

Standards and Compliance

European Technical Approval is basically an assessment of a product to make sure it is fit for its intended use within each European Member State; in our case, the assessment of *easi-joist*® for use within domestic, industrial or commercial buildings.

This assessment is based on fulfilling the 6 essential requirements set out in the Construction Products Directive (CPD). There is no suitable design method for metal web joists in Eurocode 5 unlike trusses, hence the need for ETA to provide a harmonised design standard.

**Wolf ETA Certificate No. ETA-07/0032**

*easi-joist*® has been officially approved by Robust Details Ltd. under detail E-FT-3, this means that *easi-joist*® used in timber frame flats, constructed as per E-FT-3 will not require pre-completion sound testing to prove compliance with Part E of the Building Regulations in England & Wales; saving time, money and the uncertainty of pre-completion testing.

The Irish Agrément Board Certificates establish proof that the certified products are ‘proper materials’ suitable for their intended use under Irish site conditions, and in accordance with the Building Regulations 1997 to 2006.

The Irish Agrément Board operates in association with the National Standards Authority of Ireland (NSAI) as the National Member of UEAtc.

**Wolf IAB Certificate No. 07/0280**

ISO 9000 is the internationally recognised standard for an organisation’s internal Quality Management. The term ‘quality’ refers to all those features of a product or service which are required by the customer.

An organisation’s ‘Quality Management’ refers to an organisation’s actions to ensure that its products or services satisfy its customers’ quality requirements and complies with any regulations applicable to those products or services.

Wolf Systems supplies all its products and services to ISO 9001 ensuring the highest standards are provided by our company.

*easi-joist*® is recognised for use in floor construction by the NHBC in the United Kingdom and Homebond in the Republic of Ireland.

NHBC is the standard setting body and leading warranty and insurance provider for new and newly converted homes in the UK.

HomeBond is the national organisation which since 1978 has enabled Home Builders to provide their customers with new home warranties and deposit and stage payments cover in Ireland.
**Introduction**

The easi-joist® is a parallel chord truss utilising stress graded timber chords. These chords are plated together with a precision engineered and manufactured structural component called the metal web and, when combined, form the easi-joist®.

The easi-joist® combines the lightness of timber with the structural qualities of metal. Together these two materials offer an opportunity for designing commercial, domestic and industrial floor applications with spans equal to and exceeding traditional timber joists and their equivalent timber alternatives, but with better damping and stiffness qualities.

easi-joist® is a precision designed and manufactured floor system, created to make floor joist manufacture faster, more cost effective and easier to install.

**Timber**

Timber used in the design of easi-joists® is kiln dried and stress graded, and complies with current European and British Standards.

**Preservative**

Joist timbers may be treated with waterborne solutions, or with non-corrosive spirit-based organic solvents. Copper chrome arsenate and similar treatments are not recommended.

**Features**

- Factory manufactured, made to measure.
- Long continuous spans, reducing or eliminating the need for intermediate support walls.
- Light and easy to handle.
- Increased spacing centres.
- Dimensional stability.
- Design accuracy through specialist software.
- Trimmable ends to facilitate installation where bearing support is inconsistent.
- Wide nailing surface making the nailing and gluing of decking quicker and more accurate.
- Improved floor performance.
- Stiffness and strength built into the floors improving floor rigidity.

**The Benefits of easi-joist®**

**Open web design**

This allows for easier, more practical, installation of services including waste water pipes, electrical cabling, heating pipes and other services. The open design eliminates the requirement for any holes to be positioned or drilled reducing labour costs and incorrect workmanship.

**Light weight**

The combination of smaller timber sections with the lightweight metal web means that the finished product is lighter than timber and much lighter than timber equivalents.

**Handling and installation**

Large bearing surface allows a speedy set out of joists, improves joist stability when laying out joists and enables easier fixing of decking materials.

**Reduced site wastage**

The precision-manufactured easi-joist® virtually eliminates all site alterations, and standard timber sizes ensure materials are readily available.

**Long-term stability**

The reduced timber section used in the manufacture of the easi-joist®, combined with the metal web mean that there is less loss of moisture and shrinkage, thus providing a quieter and longer lasting floor system.

**Improved sound performance and reduced vibration**

The metal web floor system allows for the installation of a rigid Strongback that reduces vibration and improves the overall acoustic performance of the floor.
The easi-joist® system comprises a number of parts that make up the complete floor structure. Knowledge of each part and its use is essential to the basic understanding of floor design. Below, we provide the typical definitions for these parts as defined for an individual joist member and the floor system as a whole.

### Joist Definitions
(See glossary for details on definitions)

- **Column plate**
- **Top chord**
- **Top chord splice**
- **Metal web**
- **Intermediate support**
- **Bottom chord splice**
- **Strongback**
- **Bottom chord**
- **Column**
- **End column**

Accommodation of Services
A significant advantage of the *easi-joist*® floor system is the open web design. The space provided by the metal web allows for the easy installation of services within the void.

Pipework, electrical cables and ducting can be easily routed through the joist space providing real time saving. By removing the laborious work needed for notching, drilling or cutting holes when using other joist systems the installation cost of services can be greatly reduced.

Furthermore, the curved edges of the webs and the absence of protruding plate edges removes any potential for damage when feeding through pipes and cables.

In addition to the need to install traditional ventilation services in bathrooms and kitchens, government initiatives for air tightness will require the installation of further mechanical systems for heat recovery and air exchange. The open web design provides an ideal zone for the passage of ducting for these devices.

Floor Cassettes
The benefits of off-site construction is widely recognised and the manufacture of floor cassettes is becoming increasingly more popular.

Floor cassettes offer numerous advantages over construction of the floor on-site, such as:
- Quality
- Control
- Speed of construction
- Space on site
- Site wastage

easi-joists® are ideally suitable for the manufacture of floor cassettes. Along with the advantages on-site for the accommodation of services and long-term stability, the wide bearing surface makes it easier to lay out the joists in preparation for adding rimboard, blocking and decking during assembly of the floor cassette.
Approvals
To supply easi-joist® in the UK and Ireland it has been necessary to ensure the floor system meets the requirements of The Building Regulations.

European Technical Approval (ETA)
After exhaustive tests carried out by BMTRADA, easi-joist® was the first metal web floor system to attain ETA approval.

Irish Agrément Board (IAB)
After satisfying the requirements of the IAB, easi-joist® has been approved for supply in the Republic of Ireland.

United Kingdom
Intermediate Floors
Typical detailing for intermediate floor construction using easi-joist®. See specification and detail below.

Intermediate Floor Construction Specification
- Joists: 219mm easi-joist® at 600mm centres.
- Ceiling: 15mm plasterboard fixed at 230mm centres as per manufacturer's specification with 38mm Gyproc drywall timber screws.
- Decking: 22mm tongued and grooved moisture resistant chipboard fixed with 51mm Gyproc drywall timber screws and appropriate adhesive. Screws to be spaced at 200mm at the perimeter and 300mm on intermediate support. Adhesive bead to be placed along joist top chord prior to decking placement. See pages 24 - 27.

Intermediate Floor Construction Detail
22mm t&g chipboard walking surface

Min. 35 x 97mm Strongback
(See page 16 for details)

Plasterboard 15mm plasterboard (standard) Bearing 75mm

Fire Resistance (30 minutes)
The easi-joist® floor system has been tested in accordance with BS 476: Part 21: 1987 and achieved a fire resistance exceeding Requirement B3 of The Building Regulations.

Acoustic Performance
The easi-joist® floor system has been tested in accordance with BS EN ISO 140 – 3: 1995 and achieved a weighted airborne sound reduction index which exceeds Requirement E2 of The Building Regulations.

NOTE
Insulation not required to meet sections B3 or E2 of The Building Regulations.
Separating Floors (cont)
easi-joist® has been officially approved by Robust Details Ltd under detail E-FT-3. This means that easi-joists® used in timber frame flats, constructed as per E-FT-3, will not require pre-completion sound testing to prove compliance with Part E of the Building Regulations in England and Wales.

To ensure compliance, it is essential the floor is carefully constructed with specific floor and ceiling materials. See below for details.

Separating floor construction (Robust Detail E-FT-3): 60 minutes fire resistance

- Two layers plasterboard
  - total nominal mass per unit area 22 kg/m²
- 5mm polyethylene foam flanking strip
- 18mm t&g floorboarding
- 19mm plasterboard (nominal 13.5 kg/m²)
- 70mm (compressed depth) resilient battens at 400mm centres
- Min. 254mm deep easi-joist®
- 100mm mineral wool (10-36 kg/m³)
- CT1: Two layers of gypsum-based board, 19mm thick (nominal 13.5 kg/m²), and 12.5mm thick (nominal 10 kg/m²)
- OR
- CT2: Two layers of gypsum-based boards, each 15mm thick (nominal 11.7 kg/m²)

PLASTERBOARD FIXINGS MUST NOT TOUCH JOIST

- 1st layer
- Resilient bar and plasterboard fixing
- Screw fixing for 1st plasterboard layer
- 2nd layer
- Screw fixings for 2nd plasterboard layer

Robust Detail loads

**Top chord**
- a. 1500 N/m² (Live load)
- b. 220 N/m² (Partitions)
- c. 475 N/m² (Robust makeup dead load)
  - 5mm polyethylene foam strip
  - 18mm t & g floor boarding
  - 19mm plasterboard
  - 70mm resilient battens
  - 25mm insulation (10-36 kg/m²)
  - 18mm OSB
  - Self weight

**Bottom chord**
- a. 366 N/m² (Robust makeup dead load)
  - 100mm mineral wool (10-36 kg/m²)
  - Resilient bars at 400mm centres
  - 2 layers plasterboard
  - Self weight

Note
This floor construction is for timber frame buildings only built in accordance with Robust Details and has not been approved for masonry construction. For further information on the easi-joist® robust detail, please contact Wolf Systems’ Design Office.
Republic of Ireland

Intermediate Floors

Typical detailing for intermediate floor construction using easi-joist®. See specification below and detail opposite.

Intermediate Floor Construction Specification

- Joists: 219mm easi-joist® at 400mm centres.
- Ceiling: 12.5mm plasterboard fixed at 230mm centres as per manufacturer’s specification with 38mm Gyproc drywall timber screws. Ceiling finished with nominal 5mm (minimum of 3mm) plaster skim coat.
- Decking: 18mm tongued and grooved moisture resistant chipboard fixed to manufacturer’s recommendations.

Intermediate Floor Construction Detail

18mm &g chipboard walking surface

Plasterboard 12.5mm plasterboard Bearing 75mm

Min. 35 x 97mm Strongback (See page 16 for details)

Fire Resistance (30 minutes)

The easi-joist® floor system has been successfully tested in accordance with BS 476: Part 21: 1987.

The fire resistance of floors incorporating easi-joists® varies according to the type of floor construction.

Acoustic Performance

The easi-joist® floor system has been tested in accordance with BS EN ISO 140 – 3: 1995 and achieved a weighted airborne sound reduction index which exceeds Requirement E2 of The Building Regulations.

18mm chipboard, 18mm plywood, 18mm OSB or 21mm &g timber boarding to be nailed at 200mm nominal centres to joists

Intermediate floor construction: 30 minutes fire resistance with easi-joists® at more than 400mm centres

22mm chipboard, 18mm plywood, 18mm OSB or 21mm &g timber boarding to be nailed at 200mm nominal centres to joists

Intermediate floor construction: 30 minutes fire resistance with easi-joists® at 400mm centres

Nominal 5mm (minimum 3mm) skim coat

12.5mm type 1 plasterboard fixed with plasterboard screws at 230mm centres (no breaches to ceiling)
Republic of Ireland

Separating Floors

Acoustic Performance

The type of floor construction used will determine the resistance to impact and airborne sound. Test data has been reviewed which indicates that the sound insulation properties of compartment floors, incorporating easi-joist®, are at least as good as those of similar construction incorporating traditional joists.

The sound resisting properties depend on the sealing and integrity of the construction being maintained intact. Services and openings shall not be located within or through the voids unless specified in and installed strictly in accordance with the design drawings. Where openings are permitted, appropriate steps shall be taken to seal them, to achieve the required performance levels.

Fire Resistance (60 minutes)

The easi-joist® floor system has been successfully tested in accordance with BS 476: Part 21: 1987.

See illustration below for typical detailing of separating floor with 60 minute fire resistance.

Separating floor construction: 60 minutes fire resistance
Span Tables

The following span tables are to be used as a basic guide to achievable joist span for given depth and spacing, and should be used for estimating or feasibility only.

Due to variations in timber grades, load sets, support conditions and bearing widths, the tables are not suitable as a design tool. Please consult an easi-joists® manufacturer for more information and design assistance.

Load Criteria
Spans are calculated based on the following applied floor loadings:

- Top chord (live) 1500 N/m²
- Top chord (dead) 210 N/m²
- Top chord (partitions) 220 N/m²
- Bottom chord (dead) 200 N/m²
- Total load 2130 N/m²
Support Conditions (SC)

There are four typical support conditions used in the design of easi-joists® which provide an important benefit in flexibility for connecting to different bearing members such as timber frame, masonry or steel. For more information on support conditions, see pages 22–27 of this manual.

The support conditions below are possible for varying methods of connection to timber frame or masonry walls, or connection to steel or timber beams.

**Load Criteria**

Spans are calculated based on the following applied floor loadings:
- Top chord (live) 1500 N/m²
- Top chord (dead) 210 N/m²
- Top chord (partitions) 220 N/m²
- Bottom chord (dead) 200 N/m²
- Total load 2130 N/m²

**Notes for UK and Republic of Ireland Tables**

1. Maximum span assumes 100mm wide supports at each end, with the maximum span of the joist being taken over the supports.
2. Spans are based on deflections being limited to 0.003 x span up to a maximum of 14mm.
3. Joists are simply supported at each end, with a minimum bearing of 45mm.
4. Lateral restraint is provided by a suitably fixed floor deck, which will prevent buckling of the compression flange.
5. The joists are assumed to be part of a load-sharing system as defined in BS 5268-2, Clause 2.9.
6. Support conditions and web direction/orientation can affect the spanning capacity of a joist.
7. Spans given in the tables for UK and Ireland have been designed using support condition SC2 and are intended as a guide only.
Strongback Sizes and Installation

Strongbacks are an essential part of the floor construction as a whole. They provide essential damping qualities to the floor by connecting joists together to form a load sharing system that limits deflection and stiffens the floor. In addition it provides a useful form of lateral bracing within the floor during its construction (see pages 18, 23, 24 and 32 for further Strongback bracing details).

Fixing & Splicing

Correct installation of the Strongback and flooring material will ultimately determine how well the easi-joist® floor system will perform. It is recommended that the Strongback be installed tight to the top chord of the easi-joist® beam and should be twice nailed to the columns provided with 3.35 x 65mm wire nails. Strongbacks may be spliced where required by fixing a 600mm timber splice equally over the joint, and nailed using 6 no 3.35 x 65mm nails on either side of the joint.

IMPORTANT

The correct fixing of the Strongback is essential to overall floor performance and must be carried out as instructed above. Fixing the Strongback by screwing is also satisfactory.

Deflection Limits

When Strongbacks are used, easi-joist® beams have a maximum deflection limit of 14mm or span x 0.003, whichever is least. If Strongbacks are not provided NHBC Standards 6.4-D4 (a) stipulates a maximum 12mm deflection limit. NHBC requires that Strongbacks are to be used and located according to the following rules:

- Spans less than 4.0m = Strongback not required
- Spans between 4.0m and 8.0m = 1 Strongback at centre of span
- Spans greater than 8.0m = 2 Strongbacks at equal spacing

NOTE

Strongbacks are required at a reduced spacing of 3.0m for 195mm deep easi-joists® with spans ≥ 3.0m.

Horizontal Restraint Strap

Horizontal bracing straps are required to be fixed to loadbearing walls perpendicular to easi-joists®. This member must be continuous over a minimum of 3 easi-joists®. Straps to be fixed in strict accordance with manufacturer’s instructions.

35 x 97mm timber fixed to each joist by 2/no 4.0 x 75mm nails

Splice joint

600mm minimum timber splice nailed with minimum 6/no. nails either side
**Suspended Ground Floors**

When designing and installing easi-joists® at ground floor level, the following points should be considered.

Ground floor suspended floors are classified as Service Class 2 and therefore will have an increased moisture content.

Adequate provision should be made for ventilation of the void below the joists which must be maintained at a minimum of 150mm deep and comply with Building Regulations.

The absence of a ceiling covering results in the bottom chord of the easi-joist® having no lateral restraint. Therefore noggins must be installed along intermediate supports to prevent buckling where the bottom chord will be in compression.

Deflection limits may be reduced to account for the reduced stiffness of the floor compared to floors fitted with a ceiling diaphragm.

Large appliances such as washing machines or spin dryers may produce dynamic movement requiring more stringent deflection limits.

Induced dynamic movement will be reduced by using a discontinuous joist layout between separate ground floor rooms.

**British Standard Service Classes**

- **Service Class 1**
  Internal use in continuously heated building, 12% moisture content
- **Service Class 2**
  Covered and generally heated, 15% moisture content
- **Service Class 2**
  Covered and generally unheated, 18% moisture content
- **Service Class 3**
  External use, fully exposed, more than 20% moisture content
Loading

Dead loads
Dead load should account for all building materials in the floor structure including ceiling linings and insulation. This should also include non-load bearing partition walls which have not been accounted for with line loads. The minimum dead load for single occupancy domestic floors including the floor deck, self-weight of joists and plasterboard, but excluding any allowance for non-load bearing partitions should be a minimum of 0.41 kN/m².

Imposed loads
Imposed or “live” loads are generated by the intended use and occupancy of the floor generated by moveable partitions and domestic storage, concentrated, impact and inertia loads.

Imposed loads are the loads produced by the occupancy of a building including storage and inhabitants. The imposed floor load compatible with the building usage should be obtained from BS 6399-1 and BS EN 1991-1-1. Typical imposed uniformly distributed floor loads are shown on page 19.

Additional loads
Care should be taken to ensure additional loads are considered within the design of easi-joists®. Examples of additional loads are snooker tables, load bearing walls, access hoists, home multi-gyms, spa baths, water storage cylinders and chandeliers.

Each of these examples will require region, line or points loads to be additionally applied to the floor design. The list is not exhaustive and advice should be sought if in doubt regarding additional loads.

Partition loads
It is the guidance of the EWP code of practice that loading which allows for the self-weight of non-load bearing partitions shall always be applied to the design of domestic floors using easi-joists®, irrespective of whether non-load bearing partitions are present on the floor.

The self-weight of partitions should be accounted for by applying loads in accordance with the following:

1. Where the location of partitions are known, joists should be designed for the most onerous of the following:
   • a minimum line load at partition locations of 0.64 kN/m.
   • a minimum uniform load of 0.22 kN/m².

2. Where the location of partitions are not known, joists should be designed for a minimum load of 0.22kN/m².

The minimum partition load of 0.64 kN/m is applicable for partitions weighing up to 27 kg/m² and 2.4m high.

Stair loads
Wherever stairs are fixed to easi-joists® the dead and imposed load from the stairs should always be applied to the floor.

Stiffness
The dynamic action of any floor system is dependent on the floor geometry, the applied loads and the level of expectation of the occupants.

Damping
Components can be added to the building structure which act to reduce vibration and deflection of the floor. This is known as damping.

An important contributor to the damping effect is the Strongback, a solid timber member running perpendicular to the joists. By providing a solid connection between adjacent joists, the movement of any individual joist is reduced.

The improvements to the floor gained by the installation of a Strongback are dependent on its correct size, position and fixture to the easi-joist®.

Strongbacks are generally provided at the centre of any span greater than 4m.

Other floor damping components include internal walls, resilient battens and floor or ceiling coverings screwed directly to the joists. Damping is achieved by reducing the effective area or by restraining the dynamic action of the floor.

See page 16 for more details on Strongbacks.

**T1 • Internal Wall Lapped Joists**

Easi-joists® take full bearing.

**T2 • Internal Wall Butted Joists**

Optional plywood splice.

**T3 • Intermediate Support (on to stud wall)**

Load bearing wall above.

Studs positioned beneath joists.

Solid or EWP blocking panel.

**T4 • Intermediate Support (on to stud wall)**

Load bearing wall above.

Studs positioned beneath joists.

50mm maximum gap.

**T5 • Bottom Chord Support with Trimmable End and Rim Board**

Solid or EWP Rim Board.

easi-joist® with single end column and trimmable end.

**T6 • Bottom Chord Support with Rim Board Closure**

Solid or EWP Rim Board.
**T7 • Bottom Chord Support with Restraint Noggings**
- Continuous restraint nogging
- Sawn timber blocking
- *easi-joists* take full bearing

**T8 • Bottom Chord Support with Full Height Blocking**
- Full height Solid or EWP blocking
- *easi-joists* take full bearing

**T9 • Top Chord Support**
- Packers
- Top chord fixed to header binder

**T10 • Top Chord Support with End Column**
- Packers
- Top chord supported *easi-joists* with single end column

**T11 • Bottom and Top Chord Support with EWP Rim Board**
- EWP Rim Board
- *easi-joists* take partial bearing top and bottom

**T12 • Top Chord Support with Double Rim Board**
- Double Rim Board
- *easi-joists* take top chord bearing
**T13 • Top Chord Support on Ring Beam**

- Packers
- Top chord fixed to ring beam or header binder
- Ring beam

**T14 • Proposed Arrangement for Timber Frame Construction**

- 72 x 47mm verge joist
- Stud pack
- Upper floor panel
- Extra columns
- Adhesive bead
- Head binder
- Sheathing
- Decking
- Plasterboard
- Lower floor panel

**T15 • Proposed Arrangement for Timber Frame Construction**

- Stud pack
- Upper floor panel
- Plasterboard batten
- Decking
- Adhesive bead
- Plasterboard
- Lower floor panel

**T16 • General Arrangement for Timber Frame Construction**

- Upper floor sole plate
- 72 x 47mm verge joist
- Solid or composite timber rim board
- Sheathing
- Decking
- Adhesive bead
- Plasterboard
- Lower floor panel

**T17 • Proposed Arrangement for Timber Frame Construction**

- Upper floor panel
- Decking
- Adhesive bead
- Plasterboard
- Lower floor panel

**T18 • Non-Loadbearing Wall Support Parallel with Joists**

- Noggings at 600mm centres
- Sole plate nailed to noggings
- Adhesive bead
- Z-Clip
- Plasterboard
Introduction

Metalwork items required for easi-joist® floor systems can be obtained from either Cullen Building Products or Simpson Strong-Tie and are available in a variety of sizes to suit the entire easi-joist® range.

Timber Hangers

There are two main types of timber to timber connection associated with easi-joist® floors – trimmers supporting onto easi-joists and trimmers supporting onto solid timbers. In both cases a trimmer itself could be either solid timber or easi-joist®.

Cullen UW / HW or Simpson IUB / HIUB:
Both ranges are designed specifically for easi-joist® to easi-joist® connections but can also accommodate solid or composite timber as supported items. Hangers are designed to suit the specific depth of the supporting easi-joist® and have nail or screw holes aligned with both top and bottom timber flanges.

Cullen KH / MHE range or Simpson JHA / SAE range:
Joist hangers designed for solid timber to timber connections which can also accommodate easi-joists® as supported items. KH and JHA strap hangers are versatile but have limited flange depth making them unsuitable for deeper joists. MHE and SAE face fix hangers offer higher safe working loads.

Restraint strap

Provides lateral restraint to the floor system by creating a positive connection between joists and parallel end walls. The strap is made from 1.5mm galvanised steel 1.5m long and is fixed in place with 3.75 dia. x 30mm square twist nails. Straps should be fitted at a maximum of 2m spacing between joist support positions.

Additional parallel restraint spacing (as shown in photograph) are also required every 2m unless the masonry shoes provide restraint.

Masonry Hangers (Cullen JHIR range or Simpson JHM range)

Hangers are required to bear directly onto masonry with a minimum crush strength of 3.5N/mm² which should be extended to a minimum of 675mm (3 block courses) above the hanger and allowed to cure before loads are applied.

The supported joist should finish no greater than 6mm away from the face of the hanger. Masonry hangers may also be shot fired onto steel beams.

Z Clips

Double angled brackets which quickly and securely locate and fix noggins to top or bottom flanges without need to stagger the noggins. Primarily used for perimeter noggins or for noggins supporting walls running parallel to joists.

Joist Girder Screws (Cullen Timberlok or Simpson SDS)

These are self-tapping coach screws with a hexagonal head available in a variety of lengths.

Drive into top and bottom chords at maximum 600mm centres to fix joists into a multi-ply girder.

Note

For all metalwork items, consult manufacturer’s information for full fixing details and safe working loads.
Introduction

easi-joists® can easily be adapted to create pitched roof structures as a lighter, more insulating alternative to solid sawn timber. By redesigning the end column configuration, the easi-joist® system can be installed onto a wallplate or ridge beam without the need for a bevelled wallplate or special metalwork item. This versatile connection detail enables top and bottom supports to accommodate a range of bearing widths and can also incorporate intermediate supports.

Using joists for roof structures requires considering external loading factors and more complex geometry at eaves and ridges.

Loading

Dead load should account for all building materials in the roof structure including ceiling linings and insulation.

Deflection is limited by BS 5268 to 0.003 times the span.

For roofs with pitch less than 30°, a man point load check (900 N) should be applied to the centre of any span as a short term load assuming no imposed loading. For steeper pitches, the load is assumed to be spread by a roof ladder.

Snow

Flat roof

Imposed (snow) load should be a minimum of 750 N/m² depending on geographical location.

Pitched roof

Imposed (snow) load should be minimum of 750 N/m² until 30° pitch whereupon it drops linearly to zero at 60° pitch.

In order to calculate dead load, refer to BS 648 Weights of Building Materials or the roof covering manufacturer’s literature.

Wind

If a structural engineer identifies that the roof covering is not sufficient to resist wind uplift (usually in the case of light roof coverings at high elevations with low pitches) then further measures must be taken to vertically restrain the joists to the wallplate. For example, restraint straps may be used to anchor the roof structure to the masonry.

Bracing:

easi-joist® roofs should be temporarily braced longitudinally and diagonally during erection.

Structural sarking is the preferred method of providing racking resistance for the roof structure, however longitudinal and diagonal bracing can also be used.
NOTES ON INSTALLATION

Easi-Joist Technical Guide

DO ORIENT CORRECTLY

Joists are designed with a specific top and bottom chord. Refer to joist profile plots for correct orientation.

DO NOT DRILL TIMBER

DO NOT CUT TIMBER

DO NOT DAMAGE OR REMOVE WEBS

DO NOT NOTCH TIMBER

DO USE WEB OPENINGS FOR SERVICES

DO CUT TRIMMABLE ENDS IF REQUIRED

DO SPACE CORRECTLY

Refer to joist profile plots for maximum joist spacing.

IMPORTANT

Easi-joists® are manufactured as part of the floor system as a whole

Modification of joists is strictly prohibited
Handling:
• The site manager or contractor will be responsible for the handling of easi-joists® from the time of unloading the delivery.
• Avoid dropping, twisting or subjecting easi-joists® to heavy impact.
• Always lift easi-joists® in the upright position to prevent lateral distortion.
• Use a fabric sling for lifting joists and ensure even weight distribution.

Storage:
• Storage time of easi-joists® prior to installation should be kept to a minimum.
• easi-joists® should be left in bundles and remain in packaging until used.
• During such time, joists should be kept dry, and laid horizontally in an upright position, clear from the ground. Bearers should be used underneath web or column joints to prevent distortion.
• Joists are unstable until fully braced or boarded. Do not walk or store materials on an unrestrained floor area.
• Sheet materials stacked on the easi-joist® floor should not exceed 250mm in height and 150 kg per joist. The stack must not extend more than 1500mm from the edge of the floor with its longest span perpendicular to the joists.

Safety:
• Use protective gloves when manually handling easi-joists®.
• Refer to plans for joist weights, remembering to account for multiply girders.
• Observe health and safety regulations as set out by CDM2007.

Planning
• Study layout drawings and plan which section will be erected first, starting from which end. Identify girder joists and stair trimmer which will need to be installed first to provide support for others.
• Check support conditions for all joists ensuring all internal supporting walls are present and that all supporting masonry is cured.
• Identify joists by reference number and place them next to required areas. (joists should not be moved from dry storage until immediately before erection)

Installation:
• All joist are to be installed truly vertical, parallel and top side up.
• Refer to layout plans or profiles for the correct orientation of the joist.
• Noggings, restraint straps, decking and strongbacks should be properly installed to the specification of the manufacturer or designer.
• Where masonry hangers are used, ensure at least three courses of blockwork or equivalent have been laid and the mortar cured before the floor is used.
• Spacing and loading of easi-joists® must not exceed that stated in the design.

Checking
• Ensure all joists are fully bearing on their supports, packing gaps if necessary.
• Check adjacent joists are level with each other and the ends of the joists form a straight line.

Health and Safety continued on page 32
**Temporary erection bracing**

The builder is responsible for identifying and minimising the risks involved in erecting open-web joists to ensure that the health and safety of workers is maintained. Builders should be aware of the health and safety responsibilities imposed on them by the Construction (Design and Management) Regulations 2007.

Proper erection procedures and bracing are vital to the safe construction of open-web joist floors.

The following notes may assist builders in preparing a safety assessment:

- **Un-braced joists may be unstable.**
- **Do not allow anyone to walk on un-braced joists.**
- **Do not store building materials on un-braced joists.**
- **Open-web joists should be erected straight and vertical.** Horizontal deviation: 10mm max. Vertical deviation: 2mm max.
- **Temporary bracing comprises diagonal brace, longitudinal brace and permanent strongbacks.**

- **All longitudinal braces, diagonal braces, strongbacks and hangers, should be completely installed and fully nailed as detailed.**
- **Lateral strength should be provided by a diagonally braced system across at least 3 joists as shown in the temporary bracing diagram. Additional braced and blocked systems should be provided at 12m spacing in long joist runs.**
- **Construction materials may only be stored on joists when all bracing is in place. The material should be spread over at least 4 joists and not more than 1500mm from a support. Floor/ceiling boards may be stacked up to 250mm high (150 kg per joist at 600mm centres, 100 kg per joist at 400mm centres) on braced floors.**
- **Flooring should be fully fixed to the joists before additional loads are placed on the floor.**
- **Temporary bracing may be progressively removed as decking is fixed.**

**Strongback details**

Fix 75 x 38mm (min) blocks to top and bottom chords with 2.no. 65 x 3.35mm wire nails. Insert strongback through joists before fixing joists in position, as it may not be possible to do this at a later stage. Position strongback tight to underside of top flange. Fix 97 x 35mm (min) strongback to blocks with 2/no. 65 x 3.35mm wire nails.

---

**Construction materials shall only be stored in the 1.5m edge zone at one end of the joist only**

**Joists supported by masonry hangers to have minimum 675mm cured masonry above hanger level or as advised by hanger manufacturer**

**Nail all binders and braces to each joist with 2/no. 65 x 3.35mm nails**

**Do not store construction material close to trimmers**

**Decking can be laid in lieu of diagonal bracing**

---

Extract taken from Code of Practice for Engineered Wood Products

**Temporary bracing**

This diagram indicates temporary erection bracing only. It is applicable to both masonry and timber frame construction.

</tbody>
</table>
Bearing
The area of a member receiving structural support.

Building Designer
The person responsible for the structural stability and integrity of the building as a whole.

Cantilever
The part of a structural member extending beyond the end support.

Chord
The horizontal timber members at the top and bottom of an easi-joist®.

Column
A vertical timber block fixed between the chords of an easi-joist®.

Compartment Floor
Separating two dwellings and required to provide sound resistance and 1 hour fire resistance.

Compression Block
A vertical timber block fixed to the side of joists where substantial vertical loads are applied.

Dead Load
The load produced by the fabric of the floor structure.

Decking
Timber boarding providing the floor or roof surface.

Deflection
Vertical deformation due to loading.

Dwang
A structural member comprising of two chords with columns at set spacing.

Dwarf Wall
A load bearing timber frame wall of similar depth to the floor joists.

easi-joist®
An engineered joist made from stress graded timber chords fixed with galvanised steel webs.

EWP
Engineered Wood Product - a man-made composite timber product.

Header Binder
Horizontal length of timber fixed onto the top rail of a timber frame panel.

Imposed Load
The load produced by the occupancy of a building including storage and inhabitants.

Intermediate Support
Structural support within the span of a joist.

Line Load
A UDL applied along a single line.

Live Load
Also known as IMPOSED LOAD.

Nogging
A horizontal timber block fixed between the chords of adjacent joists.

OSB
Oriented Strand Board - a composite product made from strands of wood and glue.

Partition Wall
Timber framed non-load bearing wall applying a load to the floor below.

Point Load
A force applied at a single position.

Rim Board
A product used on the perimeter of a building to enclose the floor structure.

Ring Beam
A structural beam used to distribute floor loads evenly to the walls below.

Services
Pipe work, ducting and cables laid within the floor zone.

Sheathing
OSB or plywood sheets nailed to timber frame panels to provide racking resistance.

Span
The overall length of a joist.

Strongback
A structural timber fixed perpendicular to a run of easi-joists® to reduce deflection.

SVP
Soil Vent Pipe.

Trimmable End
Timber allowed for tolerance which can be removed without compromising the joist.

Trimmer
A structural member framing a floor opening.

UDL
Uniformly Distributed Load - either an area load (N/sq.m) or a line load (N/m).

Web
A diagonal galvanised steel strut fixed into the chords of an easi-joist® with pressed nails.

Support

From our UK headquarters in Coventry, Wolf Systems supports a network of easi-joist® manufacturers across the UK and Ireland.

A team of highly trained and experienced personnel provide technical, practical and commercial solutions for our manufacturers and their customers.

We use the latest internet based support packages together with on-site support services to ensure easi-joist® manufacturers receive comprehensive and relevant support and assistance.

Software

easi-joist® metalweb floor joists are designed and detailed using computer design software which is written by Wolf Systems. We have extensive knowledge of producing technically expert user-friendly design software for timber engineering applications and our experience in this area is of proven benefit to our customers and manufacturers.

All of our software is written in the UK for the UK and Irish markets, allowing us to tailor our applications to meet the demands of the local environment and ensure easi-joist® manufacturers have the tools they need to quickly and easily design and manufacture their products.

Design Service

Wolf Systems also provides manufacturers with a design service for projects using easi-joist® metal web joists.

Using the skills and experience of our own in-house design team, Wolf Systems offer a floor design service from initial feasibility study to final construction drawing and detailing. This service assists the manufacturer, contractor and client by providing all the information necessary to achieve a quickly and easily installed easi-joist® floor.

Training

All licensed easi-joist® manufacturers receive training in the use of our design software and good floor design practice. This training takes place in a dedicated training suite at Wolf Systems’ offices.

Manufacturers also receive ongoing training to keep them up to date with relevant building regulations and technical issues as well as with important advances in our design software.

Additional training is provided for manufacturers’ sales and service staff to ensure they are aware of the benefits easi-joist® has over more traditional flooring methods.
